Potential risk of personal injury

Never stand in the immediate vicinity of loudspeakers driven at a high level. Professional loudspeaker systems are capable of causing a sound pressure level detrimental to human health. Seemingly non-critical sound levels (from approx. 95 dB SPL) can cause hearing damage if people are exposed to it over a long period.

In order to prevent accidents when deploying loudspeakers on the ground or when flown, please take note of the following:

- When setting up the loudspeakers or loudspeaker stands, make sure they are standing on a firm surface. If you place several systems on top of one another, use straps to secure them against movement.
- Only use accessories which have been tested and approved by d&b for assembly and mobile deployment. Pay attention to the correct application and maximum load capacity of the accessories as detailed in our specific "Mounting instructions" or in our "Flying system and Rigging manuals".
- Ensure that all additional hardware, fixings and fasteners used for installation or mobile deployment are of an appropriate size and load safety factor. Pay attention to the manufacturers' instructions and to the relevant safety guidelines.
- Regularly check the loudspeaker housings and accessories for visible signs of wear and tear, and replace them when necessary.
- Regularly check all load bearing bolts in the mounting devices.

Potential risk of material damage

Loudspeakers produce a static magnetic field even if they are not connected or are not in use. Therefore make sure when erecting and transporting loudspeakers that they are nowhere near equipment and objects which may be impaired or damaged by an external magnetic field. Generally speaking, a distance of 0.5 m (1.5 ft) from magnetic data carriers (floppy disks, audio and video tapes, bank cards, etc.) is sufficient; a distance of more than 1 m (3 ft) may be necessary with computer and video monitors.

ALi60/ALi90 loudspeaker

2.1 Product description

The ALi60 and ALi90 are augmented array loudspeakers for medium scale sound reinforcement applications providing a 60° and 90° horizontal dispersion respectively.

Both loudspeakers are passive 2-way designs. They house 2 x 10" neodymium LF drivers, one 1.4" exit HF compression driver with a 3" diaphragm mounted to a dedicated wave shaping device and a passive crossover network. The wave segments of each cabinet couple without gaps and sum up coherently.

Splay angles between adjacent cabinets can be set in the range from 20° to 40° in 5° increments resulting in a total coverage of 50° up to 70° for two cabinets, with a maximum total coverage of 150° per array.

All components are arranged symmetrically around the center axis of the cabinet to produce a perfectly symmetrical dispersion pattern. This setup allows for a smooth crossover design with a well defined overlap of adjacent frequency bands resulting in a very consistent and accurate horizontal dispersion.

Due to the bipolar arrangement of the LF drivers, broadband horizontal directivity control of $60^{\circ}/90^{\circ}$ is maintained down to 550 Hz/370 Hz respectively. The frequency response extends from 60 Hz to 18 kHz.

The cabinets are constructed from marine plywood with an impact resistant black paint finish. The front of the loudspeaker cabinet is protected by a rigid metal grill backed by an acoustically transparent fabric.

Three M10 threaded inserts are incorporated in one side panel to allow the secure attachment of a dedicated flying adapter.

A-Series rigging components

When the d&b Z5455 AL Flying frame is used, up to four loudspeaker modules can be flown in vertical columns producing a 60° or 90° constant directivity dispersion pattern in the horizontal plane.

ALi60 and ALi90 can also be deployed as a horizontal cluster of maximum four cabinets using the d&b Z5456 AL Flying adapter.

The d&b Z5458 AL Base plate allows ground stack setups of up to three TOP cabinets, either as pure TOP ground stacks or placed on top of applicable d&b subwoofers, such as the Vi-SUB or Vi-GSUB.

2.2 Connections

NOTICE!

Risk of damage to the system components!

Different pin assignment on the loudspeaker and amplifier.

 \Rightarrow Please refer to the corresponding amplifier manual.

The cabinets are fitted with a 4-pole Phoenix connector socket (Type: DFK PC 4/4 GF) using the pin assignment 1:+, 2:-, 3:+, 4:-. Pins 1/3 and 2/4 are linked. A corresponding Phoenix plug (Type: SPC 5/4) is enclosed with the cabinet.

Using pin 1/2 as the input, pin 3/4 allows for direct connection to a second cabinet.

d&b LoadMatch

With the d&b four channel amplifier platform, the LoadMatch function enables the amplifier to electrically compensate for the properties of the loudspeaker cable used without the need for an additional sense wire. For applicable loudspeakers, LoadMatch is therefore independent of the connector type used.

Phoenix specifications and recommendations

The cabinet comes with a Phoenix plug (type: SPC 5/4 Push-in spring connector) which is already connected to the corresponding Phoenix socket of the cabinet.

The plug allows for direct wire connection without any tools depending on the cross-section and conductor structure.

Technical specifications

Flexible, ferrule without plastic sle	eve up to 6 mm ² (AWG 9)
Flexible, ferrule with plastic sleeve	
Ferrule length (min/max)	
Release tool	Flat-tip screwdriver 0.6 x 3.5 x 100 mm
Recommended connectin	ig cable
d&b K3116.100 MC2 SWR	
Ferrule without	plastic sleeve (enclosed with the cabinet)

WR option (Weather Resistance)

NOTICE!

The WR option enables operation of loudspeakers in changing ambient conditions, however it is not intended to enable permanent, unprotected operation of loudspeakers outdoors.

- Provide an additional cover over the loudspeakers.
- Aim the cabinets either horizontally or with a downward tilt.

A number of d&b loudspeakers are available in special options suitable for different types of installed applications and environmental conditions. The following options are available for the ALi60/ALi90 loudspeaker:

 Weather resistant (WR): This option is suitable for outdoor use. The cabinets have an impact and weather protected black PCP (Polyurea Cabinet Protection) finish.

WR cabinets are equipped with a cover plate which accepts either single or dual PG cable glands (Type PG13.5 for cable diameters from 6 - 12 mm).

Phoenix connector socket male, single PG (standard) or dual PG (optional)

To install the fixed connection cable, please proceed as follows:

Tools required: Screw driver (#T20).

Note: Observe the wiring diagram of the Phoenix plug and Phoenix connector socket.

- 1. Insert the connection cable through the PG screwing and connect the Phoenix plug to the Phoenix connector socket.
- 2. Push the cover plate towards the connector panel until it fits into place.
- 3. Fix the cover plate to the connector panel using the four countersunk screws.

2.3 Operation

NOTICE!

Only operate d&b loudspeakers with a correctly configured d&b amplifier, otherwise there is a risk of damaging the loudspeaker components.

Applicable d&b amplifiers: 30D|40D.

Amplifier output mode(s): Dual Channel				
Application	Setup	Cabinets per channel		
ALi60	AL60 PS AL60 Out AL60 In	2 2 2		
	AL60 AP	1		
ALi90	AL90 PS AL90 Out AL90 In	2 2 2		
	AL90 AP	1		

PS setup

The PS setup (**P**oint **S**ource) provides dedicated signal processing when ALi60/ALi90 cabinets are used in stand-alone applications.

Out/In setups (MDC)

The MDC (**M**idrange **D**irectivity **C**ontrol) function compensates for constriction and uneveness (mid-range lobing) caused by the size and geometry of an array within the 200 Hz to 2 kHz frequency range in arrays of three or four loudspeakers.

MDC provides even distribution of the lower-mid frequency range, matching the high frequency dispersion set through typical array configurations, independent of the splay angle settings.

MDC uses two setups:

Out for 'outer' cabinets and In for 'inner' cabinets.

For two loudspeakers, the **Out** setup is recommended.

For three or four loudspeakers the **Out** setup is used for the outer two cabinets of an array, while the **In** setup is used for the inner one or two cabinets.

Two loudspeakers of the same type (ALi60 or ALi90) can be linked and then be driven by one amplifier channel.

Note: Mixed A-Series array

A mixed deployment of different A-Series loudspeakers within the same array is only recommended for vertical arrays and when ArrayProcessing is used. This is due to the differing crossover functions between ALi60 and ALi90 that would otherwise lead to unexpected acoustic results.

For mixed arrays consisting of ALi60 and ALi90 cabinets, observe the dedicated setup for each loudspeaker type and the required wiring \Rightarrow required amplifier channels.

AP setup

For vertical arrays consisting of a minimum of three cabinets, the AP setup can be used.

The AP setup contains the AP data that is generated by the ArrayCalc simulation software and transferred to the applicable amplifiers via the d&b Remote network (OCA/AES70) using R1.

As soon as the data has been sent to the amplifiers, the AP setup is automatically activated.

2.3.1 Controller settings

Depending on the loudspeaker setup selected, the CUT, HFA, CPL and HFC functions are available for acoustic adjustment.

CUT mode

Set to CUT, a high pass filter with a 95 Hz cut off frequency is inserted in the controller signal path. The ALi60/ALi90 are now configured for use with actively driven d&b Vi-SUB or Vi-GSUB subwoofers.

HFA mode (PS setup only)

In HFA mode (High Frequency Attenuation), the HF response of the system is rolled off. HFA provides a natural, balanced frequency response when a cabinet is placed close to listeners in near field or delay use.

High Frequency Attenuation begins gradually at 1 kHz, dropping by approximately 3 dB at 10 kHz. This roll off mimics the decline in frequency response experienced when listening to a system from a distance in a typically reverberant room or auditorium.

CPL function

The CPL (Coupling) function compensates for coupling effects between the cabinet and close boundary surfaces. CPL begins gradually around 1 kHz, with the maximum attenuation below 400 Hz. To achieve a balanced frequency response, the CPL function can be set to dB attenuation values between 0 and -9.

Positive CPL values create an adjustable low frequency boost (0 to +5 dB) at around 65 Hz and can be set when the system is used in full range mode without subwoofers.

HFC function

Selecting the HFC (High Frequency Compensation) function compensates for loss of high frequency energy due to absorption in air when loudspeakers are used to cover far field listening positions.

The HFC function has two settings (HFC1, HFC2) for different distances the cabinets need to cover. The settings should be used selectively; HFC1 for cabinets covering distances larger than 15 m (49 ft) and HFC2 for those covering distances larger than 25 m (82 ft).

The compensation is adjusted for a typical relative humidity of 40 %. With lower humidity the absorption by air increases therefore the distances where the respective HFC setting provides a correct equalization are shorter than indicated above.

Using the HFC function provides the correct sound balance between close and remote audience areas, whilst all amplifiers driving the array can be fed with the same signal.

2.4 Dispersion characteristics

The graphs below show the horizontal and vertical dispersion angles over frequency plotted using lines of equal sound pressure (isobars) at -6 dB and -12 dB. The nominal horizontal dispersion is maintained down to 550 Hz (ALi60)/370 Hz (ALi90).

2.5 Technical specifications

System data

Frequency response (-5 dB standard)	60 Hz - 18 kHz
Frequency response (-5 dB CUT mode)	95 Hz - 18 kHz

3.1 Conformity of loudspeakers

This declaration applies to:

d&b Z0732 ALi60 loudspeaker

d&b Z0733 ALi90 loudspeaker

by d&b audiotechnik GmbH & Co. KG.

All product variants are included, provided they correspond to the original technical version and have not been subject to any later design or electromechanical modifications.

We herewith declare that said products are in conformity with the provisions of the respective directives including all applicable amendments.

Detailed and applicable declarations are available on request and can be ordered from d&b or downloaded from the d&b website at <u>www.dbaudio.com</u>.

3.2 EN54 Approval
